## 二、表的插入

## 三、数学符号（公式）

$\ell$  `\[\e11 \]`

$\mathcal{L}$  `\mathcal L`

$\mathcal{N}$  `\mathcal N`

### 1.逗号不应放进公式里面

`\alpha, \beta, k'`

应为

`\alpha$, $\beta$, $k'`

$\alpha, \beta, k'$

应为

$\alpha, \beta, k'$

\$符号里的空格会被忽略。

所以生成的pdf里，没有空格

### 2.空格表示方法

详情	代码	样式	备注
两个quad空格	<code>a \qqquad b</code>	$a \quad \quad b$	两个 $m$ 的宽度
quad空格	<code>a \quad b</code>	$a \quad b$	一个 $m$ 的宽度
大空格	<code>a\ b</code>	$a \ b$	$1/3m$ 宽度
中等空格	<code>a\;b</code>	$a \ b$	$2/7m$ *宽度
小空格	<code>a\,b</code>	$a \ b$	$1/6m$ 宽度
没有空格	<code>ab</code>	$ab$	
紧贴	<code>a!b</code>	$ab$	缩进 $1/6m$ 宽度

## 四、算法块

算法块需要调用包

```
1 | \usepackage[ruled,linesnumbered]{algorithm2e}

completeness, latency, and scalability. In this scenario, the latency of the last hop is the most critical [16]. This is because the decoder needs to process the output of a large number of parallel encoders, which rely on a large number of parallel encoders. Furthermore, the volume of data is large, and the linear increase in the number of encoders is not feasible.

## B. Coded Computing

There are two main challenges in distributed computing: How to reduce communication overhead and ensure safety. In order to calculate the final result, a large number of intermediate results need to be exchanged between computing nodes through the network. This not only increases communication overhead, but also limits the performance of distributed computing applications. For example, for the Hadoop cluster on Facebook, the average time spent in the data transfer phase accounts for 33% of the entire job execution time [4]. When running the Terasort application on a heterogeneous Amazon EC2 cluster, data shuffling will take 65% of the time. Approximately 70% of the total execution time is spent on the Self-Join application [5]. In the actual training of convolutional neural networks, communication restrictions are even more embarrassing. As we all know, millions of model parameters need to be updated in ResNet-50 [6] and AlexNet [7].
